group_confirm_file

This variable is used together with group_confirm_key. In group_confirm_file, you specify the wav file you want to play when the called party picks up the call. In the group_confirm_key variable, you define the DTMF that the called party should send to FS to bridge the call. If a wrong DTMF or no DTMF is sent, the called won't be bridged and the wav file will be repeated. Although this is the standard usage of these variables (group_confirm_key and group_confirm_file), they can be used in a more flexible manner. Please see Freeswitch_IVR_Originate#Answer_confirmation.

Usage:

```
<action application="set" data="group_confirm_file=/usr/local/freeswitch/sounds/take_call_questio
<action application="set" data="group_confirm_key=1" />
```
